

EuroTrust Bank

Releasing a new payment review journey faster - with less risk.

HOW WE'LL SPEND THE 45 MINUTES

Today's session

0 – 15 min

Discovery

Recap the customer, the pain, and the assumptions I'm making, and check them against how you'd prioritise it.

15 – 30 min

Solution & value

The two-flag build, a walkthrough in the app and LaunchDarkly, and the evidence behind it.

30 – 45 min

Objections & close

Your concerns, what is and isn't production-ready, and a recommended next step.

The roles I'm asking you to play

So we can run this like a buying-committee conversation, not a homework review.

PRODUCT

Chris

Head of Product & Business Strategy, digital

Does the new journey actually help customers complete? Is the experiment measuring something worth deciding on?

ENGINEERING

Celina

Principal Platform Engineer

What data leaves the app? What happens if LaunchDarkly is unavailable? Why server-side, and is this explainable?

EXECUTIVE SPONSOR

James

Chief Digital & Technology Officer

Release velocity, rollback risk, and whether this is meaningfully different from the CI/CD we already pay for.

01

Discovery

Who is the customer, what hurts, and what does good look like.

THE CUSTOMER

EuroTrust Bank

A regulated EMEA retail bank with a growing digital payments business. Leadership wants faster digital release velocity - but risk appetite is low.

SECTOR

Regulated retail banking, EMEA

INITIATIVE

Modernise the digital payment review journey

CONSTRAINT

Give customers clearer information before confirming a transfer - without exposing everyone at once

CURRENT PAIN

Where release risk shows up today

01 Releases feel high-risk - too many customers are exposed at once.

02 Rollback is too slow when it depends on an engineering redeploy.

03 Product can't always tell whether a new journey is actually better.

04 Risk and compliance want controlled exposure and a clear fallback.

SUCCESS CRITERIA

What good looks like for EuroTrust

- 01 Release the new flow to internal staff first.
- 02 Expand only to trusted pilot customers.
- 03 Keep standard customers on the old, stable flow.
- 04 Roll back instantly - without a redeploy.
- 05 Measure whether clearer copy improves completion.

Three assumptions I'm validating with you

A1

Release risk is about **exposure** ,
not just code quality — who
experiences the code, when, and
how fast it can be reversed.

A2

A regulated bank **starts narrow** -
internal users first, then a
controlled pilot cohort, never
broad exposure.

A3

Product confidence needs
behaviour data , not opinion, so
the rollout connects to a
measurable outcome.

Before I show the build, does that match how you'd think about EuroTrust, or would you change the priority?

02

Solution & value

The build is deliberately small, so the LaunchDarkly value is clear.

THE SHAPE OF THE SOLUTION

Two flags, two questions

RELEASE

`new-payment-review-flow`

Who sees the new payment review journey?

`false → old flow`

`true → new flow`

ITERATE

`payment-review-copy-variant`

Which wording appears inside the new journey?

`control`

`clear-risk-copy`

First flag: **who** gets the new page. Second flag: **which words** are on it.

RELEASE

Controlling who sees the new journey

new-payment-review-flow

TARGETING

internal-bank-staff	true
trusted-beta-customers	true
Default rule	false
Off variation	false

BUSINESS VALUE

Expose the new journey to internal staff and trusted pilot customers first. Standard customers stay on the old stable journey.

INSTANT ROLLBACK

Flag off → everyone served false → old stable flow.
No redeploy.

ITERATE

Learning which version wins

payment-review-copy-variant

TARGETING

trusted-beta-customers **50% control / 50% clear-risk-copy**

Default rule control

Metric	payment-review-completed
--------	--------------------------

BUSINESS VALUE

Test which wording performs better - inside the controlled pilot cohort only. Everyone outside it gets control.

THE OUTCOME

Product decides which version is better from behaviour - instead of guessing.

EVIDENCE

The experiment, end to end

251

user contexts exposed

Healthy

running · 50% / 50% split

`control`

exposed 123 · completed 84

`clear-risk-copy`

exposed 127 · completed 102

WHAT IT PROVES

The instrumentation works: pilot users were exposed, the app sent completion events, and LaunchDarkly calculated results.

WHERE I STAY HONEST

This is simulated demo traffic - not a real product winner. I'd wait for real traffic, agreed success criteria, and guardrail metrics before shipping.

END TO END

How the app and LaunchDarkly work together

1 · EVALUATE RELEASE

User opens payment review

App builds the LaunchDarkly context

`new-payment-review-flow?`

false → old flow

true → new flow

2 · EVALUATE COPY

If **new flow**, ask the second question

`payment-review-copy-variant?`

control

clear-risk-copy

3 · MEASURE

User confirms payment

`track('payment-review-completed')`

Experiment compares completion by variation

GOING LIVE

What I'll walk you through

01	Standard customer → false → old stable flow	Standard customers protected from early exposure
02	Internal employee → true → new flow	Internal users validate the journey first
03	Trusted pilot customer → new flow + copy variant	Expand to a controlled, lower-risk cohort
04	Rollback→ qualified user falls back	Instant rollback, no redeploy
05	Experiment results + completion metric	A measurable product decision

Driven live in the app and in LaunchDarkly · synthetic, non-PII users throughout.

03

Objections & close

What this is, what it isn't, and the next step I'd recommend.

What this is, and what it isn't

A proof of value

Controlled, cohort-based rollout

Instant rollback with no redeploy

A measurable iterate loop

Server-side SDK with safe fallbacks

Synthetic, non-PII context data

Not production governance

Auth, authorization, approval workflows

Audit review and secrets management

Incident response integration

Data classification

Flag lifecycle cleanup

THE CLOSE

A two-week guarded pilot

Around one real, customer-facing release — with success measures agreed up front.

MEASURE 1

Rollback time

MEASURE 2

% exposed before broad rollout

MEASURE 3

One product metric tied to the feature

Prove those, and we have the case to expand this release pattern across more digital banking journeys.

IN ONE LINE

Deploy is not release.

LaunchDarkly lets EuroTrust ship code without exposing every customer - and decide what to expand from behaviour, not opinion.

Next Steps
